Project Abstract

“The Library Management System is a web-based application designed to automate and streamline library operations, including book management, member records, and transactions. The system enables efficient cataloguing, real-time availability tracking, and secure issuance and return of books.”

Questionnaire

- What types of users should the system support ?
- What permissions should each user role have ?
- Should users be able to register themselves, or should accounts be created only by the administrator?
- How should books be categorized ?
- Do you want to track **individual physical copies** of each book or only the **total number of available copies**?
- Should the system support digital resources such as e-books, PDFs, or journals?
- Do you require advanced search options ?
- Should the system automatically calculate late return fines?
- What should be the fine amount per day for overdue books?
- Are there any exemptions from fines ?
- Should users be able to reserve or place a hold on books that are currently unavailable?
- How long should a reserved book remain blocked once it becomes available?
- Should notifications be sent when a reserved book becomes available?
- Should users be able to reserve or place a hold on books that are currently unavailable?

- How long should a reserved book remain blocked once it becomes available?
- Should notifications be sent when a reserved book becomes available?
- Should users be able to reserve or place a hold on books that are currently unavailable?
- How long should a reserved book remain blocked once it becomes available?
- Should notifications be sent when a reserved book becomes available?
